

# Exercise

Create a simplified FTP (file transport) client and server where the client can send or download text files from the server:

## General use-cases

1. ) Client connects to the server and sends a 'file listing' message
2. ) Server sends back the list of the downloadable files
3. ) Client lists the files and asks the user what action they want to take? Upload or download? ('u' or 'd')
4. ) In both cases the user must give the full file name with extension
5. ) The client sends the selected file to the server (upload) or downloads the selected file from the server to a specific directory.

## Server viewpoint

1. ) After connecting, it reads the files from the /store subdirectory and sends the file names to the client after receiving the listing message.
2. ) We are waiting for the client's 'u' or 'd' operation
3. ) We get a filename from the client and if the action is 'd' (download), we read the file content and return its contents
4. ) If the operation is 'u' (upload), we open a new file with the specified name and wait for the data to be written to the file.

## Client viewpoint

1. ) The client connects and waits for the list of files coming back and writes it to the console
2. ) We ask for the "u" or "d" key
3. ) Then we'll ask for the file-name as well.
4. ) The client reads the files from the /files folder, or creates the downloaded file here
5. ) If you press "d", it creates /files/ and writes data from the server
6. ) If you press "u", /files/ is sent to the server

# Starting point of implementation

## 1.) Hagymányos blokkolt TCP alapú socket szerver

### Socket szerver kód

```
import java.io.IOException;
import java.io.ObjectInputStream;
```

```
import java.io.ObjectOutputStream;
import java.net.ServerSocket;
import java.net.Socket;

public class Server {
    ServerSocket providerSocket;
    Socket connection = null;
    ObjectOutputStream out;
    ObjectInputStream in;
    String message;

    Server() {
    }

    void run() {
        try {
            // 1. szerver socket létrehozása
            providerSocket = new ServerSocket(8080, 10);
            // 2. kapcsolódásra várakozás
            connection = providerSocket.accept();
            // 3. Input és Output streamek megadása
            out = new ObjectOutputStream(connection.getOutputStream());
            in = new ObjectInputStream(connection.getInputStream());
            // 4. socket kommunikáció
            do {
                try {
                    message = (String) in.readObject();
                    System.out.println("client>" + message);
                    if (message.equals("bye")) {
                        sendMessage("bye");
                    }
                } catch (ClassNotFoundException classnot) {
                    System.err.println("Data received in unknown
format");
                }
            } while (!message.equals("bye"));
        } catch (IOException ioException) {
            ioException.printStackTrace();
        } finally {
            // 4: kapcsolat lezárása
            try {
                in.close();
                out.close();
                providerSocket.close();
            } catch (IOException ioException) {
                ioException.printStackTrace();
            }
        }
    }
}
```

```

    void sendMessage(String msg) {
        try {
            out.writeObject(msg);
            out.flush();
            System.out.println("server>" + msg);
        } catch (IOException ioException) {
            ioException.printStackTrace();
        }
    }

    public static void main(String args[]) {
        Server server = new Server();
        while (true) {
            server.run();
        }
    }
}

```

## Socket kliens kód

```

import java.io.IOException;
import java.io.ObjectInputStream;
import java.io.ObjectOutputStream;
import java.net.Socket;
import java.net.UnknownHostException;

public class Client {
    Socket requestSocket;
    ObjectOutputStream out;
    ObjectInputStream in;
    String message;

    Client() {
    }

    void run() {
        try {
            // 1. socket kapcsolat létrehozása
            requestSocket = new Socket("localhost", 8080);
            // 2. Input and Output streamek
            out = new
ObjectOutputStream(requestSocket.getOutputStream());
            in = new ObjectInputStream(requestSocket.getInputStream());
            // 3: Kommunikáció
            do {
                try {
                    sendMessage("Hello szerver");
                    sendMessage("bye");
                    message = (String) in.readObject();
                } catch (Exception e) {

```

```
        System.err.println("data received in unknown  
format");  
    }  
    } while (!message.equals("bye"));  
} catch (UnknownHostException unknownHost) {  
    System.err.println("You are trying to connect to an unknown  
host!");  
} catch (IOException ioException) {  
    ioException.printStackTrace();  
} finally {  
    // 4: Kapcsolat zárása  
    try {  
        in.close();  
        out.close();  
        requestSocket.close();  
    } catch (IOException ioException) {  
        ioException.printStackTrace();  
    }  
}  
}  
}  
  
void sendMessage(String msg) {  
    try {  
        out.writeObject(msg);  
        out.flush();  
        System.out.println("client>" + msg);  
    } catch (IOException ioException) {  
        ioException.printStackTrace();  
    }  
}  
  
public static void main(String args[]) {  
    Client client = new Client();  
    client.run();  
}  
}
```

## 2.) Hagyományos UDP alapú kommunikáció

2.a) Az alábbi Ágens küld egy üzenetet és a 8080-as porton várja a választ rá, ugyancsak UDP-vel. Az eclipse fejlesztőkörnyezetben a consolon beírt szöveget ctrl+z leütésével lehet elküldeni.

**Feladat:** módosítsuk a kódot, hogy át tudjon küldeni egy beégetett nevű, és létező, 2 kbyte-nál nagyobb szöveges vagy kép állományt és ellenőrizzük a sikeres küldést.

```
package org.a.it;  
  
import java.io.BufferedReader;  
import java.io.InputStreamReader;
```

```
import java.net.DatagramPacket;
import java.net.DatagramSocket;
import java.net.InetAddress;

public class UDPClient {
    public static void main(String args[]) throws Exception {
        BufferedReader inFromUser = new BufferedReader(new
InputStreamReader(System.in));
        DatagramSocket clientSocket = new DatagramSocket();
        InetAddress IPAddress = InetAddress.getByName("localhost");

        byte[] sendData = new byte[1024];
        byte[] receiveData = new byte[1024];

        String sentence = inFromUser.readLine();
        sendData = sentence.getBytes();

        DatagramPacket sendPacket = new DatagramPacket(sendData,
sendData.length, IPAddress, 8080);
        clientSocket.send(sendPacket);

        DatagramPacket receivePacket = new DatagramPacket(receiveData,
receiveData.length);
        clientSocket.receive(receivePacket);
        String modifiedSentence = new String(receivePacket.getData());

        System.out.println("átalakítva:" + modifiedSentence);
        clientSocket.close();
    }
}
```

2.b) Az UDP szerver a 8080-as porton várja az ágenszek üzeneteit és nagybetűre konvertálva visszaküldi a kliens UDP socketre.

```
package org.ait;

import java.net.DatagramPacket;
import java.net.DatagramSocket;
import java.net.InetAddress;

public class UDPServer {
    public static void main(String args[]) throws Exception {

        DatagramSocket serverSocket = new DatagramSocket(8080);

        byte[] bytesReceived = new byte[1024];
        byte[] bytesSent = new byte[1024];

        DatagramPacket receivePacket = new DatagramPacket(bytesReceived,
bytesReceived.length);
```

```
// itt várakozik ameddig adat jön a 8080-as porton
serverSocket.receive(receivePacket);

String szoveg = new String(receivePacket.getData());

System.out.println("kaptam: " + szoveg);

InetAddress IPAddress = receivePacket.getAddress();
int port = receivePacket.getPort();

String nagybetűsSzöveg = szoveg.toUpperCase();
bytesSent = nagybetűsSzöveg.getBytes();

// visszaküldi
DatagramPacket sendPacket = new DatagramPacket(bytesSent,
bytesSent.length, IPAddress, port);
serverSocket.send(sendPacket);
serverSocket.close();

}
}
```
