Socket client and server exercises

TCP style

Create a simplified FTP (file transport) client and server where the client can send or download text files from the server:

General use-cases

1.) Client connects to the server and sends a 'file listing' message
2.) Server sends back the list of the downloadable files
3.) Client lists the files and asks the user what action they want to take? Upload or download? ('u' or 'd')
4.) In both cases the uses must give the full file name with extension
5.) The client sends the selected file to the server (upload) or downloads the selected file from the server to a specific directory.

Server viewpoint

1.) After connecting, it reads the files from the /store subdirectory and sends the file names to the client after receiving the listing message.
2.) We are waiting for the client's 'u' or 'd' operation
3.) We get a filename from the client and if the action is 'd' (download), we read the file content and return its contents
4.) If the operation is 'u' (upload), we open a new file with the specified name and wait for the data to be written to the file.

Client viewpoint

1.) The client connects and waits for the list of files coming back and writes it to the console
2.) We ask for the “u” or “d” key
3.) Then we'll ask for the file-name as well.
4.) The client reads the files from the /files folder, or creates the downloaded file here
5.) If you press “d”, it creates /files/ and writes data from the server
6.) If you press “u”, /files/ is sent to the server

Starting point of implementation

1.) Traditional blocked TCP based socket server class in Java

Socket server source code

```
    import java.io.IOException;
```

```
    import java.io.ObjectInputStream;
    import java.io.ObjectOutputStream;
    import java.net.ServerSocket;
    import java.net.Socket;

    public class Server {
        ServerSocket providerSocket;
        Socket connection = null;
        ObjectOutputStream out;
        ObjectInputStream in;
        String message;

        Server() {
        }

        void run() {
            try {
                // 1. create a socket server listening to port 8080
                providerSocket = new ServerSocket(8080, 10);
                // 2. waiting for the connection (here we are waiting until
next connection)
                connection = providerSocket.accept();
                // 3. create Input and Output streams
                out = new ObjectOutputStream(connection.getOutputStream());
                in = new ObjectInputStream(connection.getInputStream());
                // 4. socket communication
                do {
                    try {
                        message = (String) in.readObject();
                        System.out.println("client>" + message);
                        if (message.equals("bye")) {
                            sendMessage("bye");
                        }
                    } catch (ClassNotFoundException classnot) {
                        System.err.println("Data received in unknown
format");
                    }
                } while (!message.equals("bye"));
            } catch (IOException ioException) {
                ioException.printStackTrace();
            } finally {
                // 4: close connection
                try {
                    in.close();
                    out.close();
                    providerSocket.close();
                } catch (IOException ioException) {
                    ioException.printStackTrace();
                }
            }
```

```
        }

        void sendMessage(String msg) {
            try {
                out.writeObject(msg);
                out.flush();
                System.out.println("server>" + msg);
            } catch (IOException ioException) {
                ioException.printStackTrace();
            }
        }

        public static void main(String args[]) {
            Server server = new Server();
            while (true) {
                server.run();
            }
        }
    }
```

Socket client source

```
    import java.io.IOException;
    import java.io.ObjectInputStream;
    import java.io.ObjectOutputStream;
    import java.net.Socket;
    import java.net.UnknownHostException;

    public class Client {
        Socket requestSocket;
        ObjectOutputStream out;
        ObjectInputStream in;
        String message;

        Client() {
        }

        void run() {
            try {
                // 1. try to connect to the socket: localhost:8080
                requestSocket = new Socket("localhost", 8080);
                // 2. Input and Output streams
                out = new
ObjectOutputStream(requestSocket.getOutputStream());
                in = new ObjectInputStream(requestSocket.getInputStream());
                // 3: communications
                do {
                    try {
                        sendMessage("Hello server");
                        sendMessage("bye");
```

```
                        message = (String) in.readObject();
                    } catch (Exception e) {
                        System.err.println("data received in unknown
format");
                    }
                } while (!message.equals("bye"));
            } catch (UnknownHostException unknownHost) {
                System.err.println("You are trying to connect to an unknown
host!");
            } catch (IOException ioException) {
                ioException.printStackTrace();
            } finally {
                // 4: close connection
                try {
                    in.close();
                    out.close();
                    requestSocket.close();
                } catch (IOException ioException) {
                    ioException.printStackTrace();
                }
            }
        }

        void sendMessage(String msg) {
            try {
                out.writeObject(msg);
                out.flush();
                System.out.println("client>" + msg);
            } catch (IOException ioException) {
                ioException.printStackTrace();
            }
        }

        public static void main(String args[]) {
            Client client = new Client();
            client.run();
        }
    }
```

Traditional UDP style

The following Agent sends a message and waits for a response on port 8080, also with UDP. In the Eclipse IDE, the text you type on the console can be sent by pressing ctrl+z

Exercise 2.

Modify the code so that you can transfer a burned-in name and existing text or image file larger than

2 kbytes and verify that it was successfully sent.

```
  package org.ait;

  import java.io.BufferedReader;
  import java.io.InputStreamReader;
  import java.net.DatagramPacket;
  import java.net.DatagramSocket;
  import java.net.InetAddress;

  public class UDPClient {
    public static void main(String args[]) throws Exception {
        BufferedReader inFromUser = new BufferedReader(new
InputStreamReader(System.in));
        DatagramSocket clientSocket = new DatagramSocket();
        InetAddress IPAddress = InetAddress.getByName("localhost");

        byte[] sendData = new byte[1024];
        byte[] receiveData = new byte[1024];

        String sentence = inFromUser.readLine();
        sendData = sentence.getBytes();

        DatagramPacket sendPacket = new DatagramPacket(sendData,
sendData.length, IPAddress, 8080);
        clientSocket.send(sendPacket);

        DatagramPacket receivePacket = new DatagramPacket(receiveData,
receiveData.length);
        clientSocket.receive(receivePacket);
        String modifiedSentence = new String(receivePacket.getData());

        System.out.println("converted:" + modifiedSentence);
        clientSocket.close();
    }
    }
```

2.b) The UDP server waits for the agents messages on port 8080 and converts them to uppercase letters and sends them back to the client UDP socket.

```
  package org.ait;

  import java.net.DatagramPacket;
  import java.net.DatagramSocket;
  import java.net.InetAddress;

  public class UDPServer {
    public static void main(String args[]) throws Exception {

        DatagramSocket serverSocket = new DatagramSocket(8080);
```

```
        byte[] bytesReceived = new byte[1024];
        byte[] bytesSent = new byte[1024];

        DatagramPacket receivePacket = new DatagramPacket(bytesReceived,
bytesReceived.length);
        // here we are waiting for the packets
        serverSocket.receive(receivePacket);

        String textMessage = new String(receivePacket.getData());

        System.out.println("I got: " + textMessage);

        InetAddress IPAddress = receivePacket.getAddress();
        int port = receivePacket.getPort();

        String upperCaseText = textMessage.toUpperCase();
        bytesSent = upperCaseText.getBytes();

        // send back
        DatagramPacket sendPacket = new DatagramPacket(bytesSent,
bytesSent.length, IPAddress, port);
        serverSocket.send(sendPacket);
        serverSocket.close();

    }
  }
```
